

铁线莲属绣球藤组修订

王文采

(中国科学院植物研究所系统与进化植物学开放研究实验室 北京 100093)

A revision of *Clematis* sect. *Cheiropsis* (Ranunculaceae)

WANG Wen-Tsai

(*Laboratory of Systematic and Evolutionary Botany, Institute of Botany, the Chinese Academy of Sciences, Beijing 100093*)

Abstract In the present revision of the sect. *Cheiropsis* are recognized 22 species and 23 varieties, which are keyed, described, and illustrated, and the classification of this section proposed by Wang (2000b) is followed with no change. The brief taxonomic history, the evolutionary trends of the important morphological characters, and the geographical distribution of the section are given. The phenomenon that the pedunculate, bibracteate cyme is reduced to a single only pedicellate flower in the *Clematis* is discussed, and five modes of origin of the only pedicellate flower are discerned.

Key words *Clematis*; Sect. *Cheiropsis*; Taxonomical revision; Only pedicellate flower

摘要 笔者在中国科学院植物研究所标本馆和欧、美一些著名植物标本馆研究了铁线莲属植物标本之后,完成了此属绣球藤组的修订,确定此组含有 22 种和 23 变种。本文还提供了组下分类群的检索表、各种植物的形态描述、地理分布、生长环境等,并附有多幅插图。笔者曾在 2000 年根据此组的重要形态特征的演化趋势制定出一个新分类系统,此系统在本修订中继续得到应用。此组重要形态特征的演化趋势的原始状态是:萼片平展,呈倒卵形,顶端圆形或钝,外面边缘无狭短绒毛带;雄蕊花药呈长圆形或狭长圆形,药隔顶端不突出;花组成具花序梗和 2 枚分生苞片的聚伞花序,生于当年生枝叶腋。衍生状态是:萼片斜上展或近直立,变狭呈长圆形、长椭圆形、披针形或倒披针形,顶端急尖、渐尖或渐狭,外面边缘出现狭短绒毛带(仅文山铁线莲一种);雄蕊花药呈条形,药隔顶端有小突起;花组成具花序梗和 2 苞片合生形成总苞的聚伞花序,或花单生,只具花梗,而无花序梗和苞片,自老枝的腋芽中生出。在铁线莲属近 300 种植物中,具有上述原始特征的只有 6 种:短梗铁线莲 *C. brevipes*、美花铁线莲 *C. potaninii*、绣球藤 *C. montana*、薄叶铁线莲 *C. gracilifolia*、丽叶铁线莲 *C. venusta* 和金毛钱线莲 *C. chrysocoma*。这 6 种中有 5 种特产我国西南部横断山区一带,只 1 种(绣球藤)分布较广,东自我国台湾省向西经过我国亚热带山区分布到喜马拉雅西部。此外,简要回顾了本组的分类历史,绘出本组分布区图,以及讨论了铁线莲属中具花序梗和二苞片的聚伞花序在此属各演化路线中出现的简化成仅具花梗单花的现象。

关键词 铁线莲属; 绣球藤组; 分类学修订; 仅具花梗的花

The sect. *Cheiropsis* was founded by de Candolle (1818), consisting of *C. cirrhosa* L., *C. semitriloba* Lag., *C. balearica* Rich., *C. napaulensis* DC., and *C. montana* Buch.-Ham. ex DC. In his classification of the *Clematis*, Prantl (1888) incorrectly transferred *C. montana* to sect. *Flammula* subsect. *Rectae* there with such unrelated species as *C. apiifolia* DC., *C. songarica* Bunge, *C. chinensis* Osb., *C. flammula* L. etc. Prantl's above treatment was followed by Schneider (1906), who established a subsection for *C. montana* under sect. *Flammula*, and by

Rehder & Wilson (1913). Rehder & Wilson (1913) placed *C. fargesii* Franch. (= *C. potaninii* Maxim.) in sect. *Flammula* ser. *Vitalbae* together with such unrelated species as *C. apiifolia* DC., *C. grata* Wall., *C. gouriana* Roxb. ex DC., and *C. brevicaudata* DC., and this treatment was followed by Johnson (1997) and Grey-Wilson (2000) in their recent revisions of the *Clematis*. In his revision of the Chinese *Clematis*, Handel-Mazzetti (1939) followed Schneider to place the subsect. *Montanae* under sect. *Flammula*, but for the first time put *C. montana* with its allies *C. gracilifolia*, *C. acerifolia*, *C. brevipes*, *C. potaninii*, *C. chrysocoma*, *C. williamsii*, *C. fasciculiflora* and *C. napaulensis* together into the same group. So, the main content of the sect. *Cheiropsis* was for the first time ascertained by him, though these species were included in subsect. *Montanae* under sect. *Flammula* instead of sect. *Cheiropsis*. This content was adopted by Tamura (1956, 1967, 1995), Chang (1980), and Wang (2000b) in their treatments of the sect. *Cheiropsis*. Based on the sepals of *C. heynei* lacking a narrow strip of velutinous indumentum on the margin of the abaxial surface, this species was considered to be a member of the sect. *Cheiropsis* by Wang (2000a). In 2000, I (Wang, 2000b) proposed a classification for the sect. *Cheiropsis*, and in this paper it is adopted with no change.

In the first half of the nineteenth century, two English botanists successively noticed the same phenomenon that the flowers of *Clematis montana* resemble those of *Anemone sylvestris*. In the protologue, Don (1825) gave the interpretation about the meaning of the specific epithet of his new species, *Clematis anemoniflora* D. Don (= *C. montana*) as follows: ‘Flores patuli, albi, fere *Anemonis sylvestris*’. Just as Don did, Loudon (1842) also provided similar interpretation for the name of his new section, § *Anemoniflora*, founded on the basis of *C. montana*: ‘Derivation. From the flowers being like those of the *Anemone sylvestris*’. In fact, among the some three hundred species of the *Clematis* (Johnson, 1997, Grey-Wilson, 2000) there are only six species, i. e. *C. brevipes*, *C. potaninii*, *C. montana*, *C. gracilifolia*, *C. chrysocoma*, and *C. venusta* with flowers similar to those of the genus *Anemone*, which is a close ally of *Clematis*, and more primitive than it. In these species just mentioned, the flowers are bisexual, the sepals are petaloid, spreading, membranous in texture, obovate in outline, at apex rounded, adaxially glabrous, abaxially appressed-puberulous, without narrow velutinous margins, and the stamens are glabrous with oblong or narrowly oblong anthers (only in some varieties of *C. montana* and *C. venusta*, the anthers are sometimes linear in outline) (Wang, 2000b). Possessing such a syndrome of primitive features, these six species might be the early descendants of the extinct primitive group of the *Clematis* (Wang, 1998), and possessing such archaic species, the sect. *Cheiropsis* may be the extant primitive group of that genus.

The morphology of the sepals and stamen anthers of the six species mentioned above may represent the primitive phase of the evolutionary trends of the section. On the other hand, the following floral morphological characters such as the ascending or nearly erect, narrowed, obovat-oblong, long elliptic, lanceolate, or oblanceolate sepals with acute, acuminate, or attenuate apexes and narrow strips of velutinous indumentum on the margin of the abaxial surface (*C. wenshanensis*), the linear anther without or with projected connective (*C. heynei*, *C. montana* var. *grandiflora* etc.) may represent advanced phase.

In the genus *Clematis*, flowers are usually arranged in pedunculate, bibracteate cymes arising from leaf axils or apexes of hornotinous branch. However, in most species of sect. *Cheiropsis*, the flowers are either solitary, only pedicellate (*C. montana* etc.) or in pedunculate, bibracteate (*C.*

williamsii) or involucrate (*C. cirrhosa*), 1-flowered cymes arising alone or with leaves from axillary buds of old branch. These phenomena are considered to be 'secondary and an adaptation to the temperate climate'. (Tamura, 1967). In subsect. *Cirrhosae*, the two bracts of the cyme are usually connate into a campanulate structure, and this phenomenon is regarded as an advanced state.

The phenomenon that the pedunculate, bibracteate cyme is reduced to a single only pedicellate flower occurs in several diverse evolutionary lines of the *Clematis*, such as in subsect. *Acerifoliae* (*C. acerifolia*), subsect. *Montanae* (*C. montana*, *C. khasiana* etc.), and subsect. *Fasciculiflorae* (*C. fasciculiflora*) of sect. *Cheiropsis*, in sect. *Fruticella* [*C. viridis* (W. T. Wang & M. C. Chang) W. T. Wang], in subsect. *Orientales* of sect. *Meclatis* [*C. tangutica* (Maxim.) Korsh.], in sect. *Viticella* (*C. patens* Morr. & Decne.), in ser. *Pogonandrae* (*C. pogonandra* Maxim. etc.) and subsect. *Bebaeanthera* (*C. barbellata* Edgew., *C. pseudopogonandra* Finet & Gagnep. etc.) of sect. *Viorna*, in sect. *Atragene* [*C. alpina* (L.) Mil., *C. macropetala* Ledeb. etc.], and in sect. *Pseudanemone* (*C. africolineariloba* W. T. Wang etc.). The modes of the origin of the only pedicellata flower in the genus *Clematis* may be discerned as follows: (a) Two only pedicellate flowers alone or with leaves arise from an axillary bud of an uppermost leaf of the stem as in *C. acerifolia*; (b) The only pedicellate flowers with leaves together arise from an axillary bud of old branch as in *C. montana*, *C. barbellata*, *C. alpina* etc.; (c) The only pedicellate flowers singularly or in pair arise from the leaf axils of horotinous branch as in *C. khasiana*, *C. pogonandra* etc.; (d) The only pedicellate flowers singularly arise from apexes of the axillary short or strongly abbreviated branchlets as in *C. viridis*; and (e) A single pedicellate flower is terminal to stem or horotinous branch as in *C. tangutica*, *C. patens*, *C. africolineariloba* etc.

Fig. 1

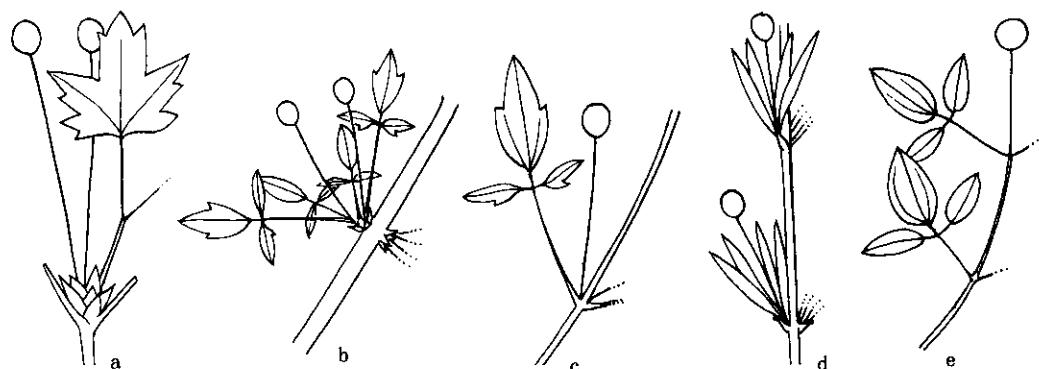

Fig. 1 Diagrams showing the five modes about the origin of the only pedicellate flowers in the genus *Clematis*
(for explanation see text)

According to the evolutionary trends mentioned above, in the sect. *Cheiropsis*, subsect. *Potaniniae* with spreading, obovate sepals, oblong or narrowly oblong anthers, and cymes arising from leaf axils of horotinous branch may be regarded as its primitive group. Subsect. *Heynianae* is somewhat remote from other subsections in its often many-flowered cymes and linear anther with projected connectives. In habit and morphology of stamens and fruits subsect. *Williamsiae* is similar to subsect. *Montanae*. However, it is difficult to explain the occurrence of the curious imbricate aestivation of the sepals. Thus, for understanding of the relationship and systematic position of the two subsections just mentioned further study is needed.

In the present revision of the sect. *Cheiropsis*, 22 species and 23 varieties are recognized. Of

them most are wide-spread in the subtropical montane regions of China and the Himalayas, and only three species are scattered in Beijing of North China (*C. acerifolia*), Southern Japan (*C. williamsii*) (Tobe, 1980), and central India (*C. heynei*) in Asia and one (*C. cirrhosa*) of the two species of subsect. *Cirrhosae* disjunctively occurs in the coastal regions of southwestern Asia, southern Europe, and northern Africa (Fig. 2). Of the six archaic species mentioned above, five are concentrated in the Hengduan Mountains and adjacent regions of Southwest China, and one (*C. montana*) ranges widely from the Taiwan Island of China westwards through the subtropical regions of China to the western Himalayas. Owing to the archaic age of these species, the distribution area of them may be significant for searching the centre of origin of the genus *Clematis*.

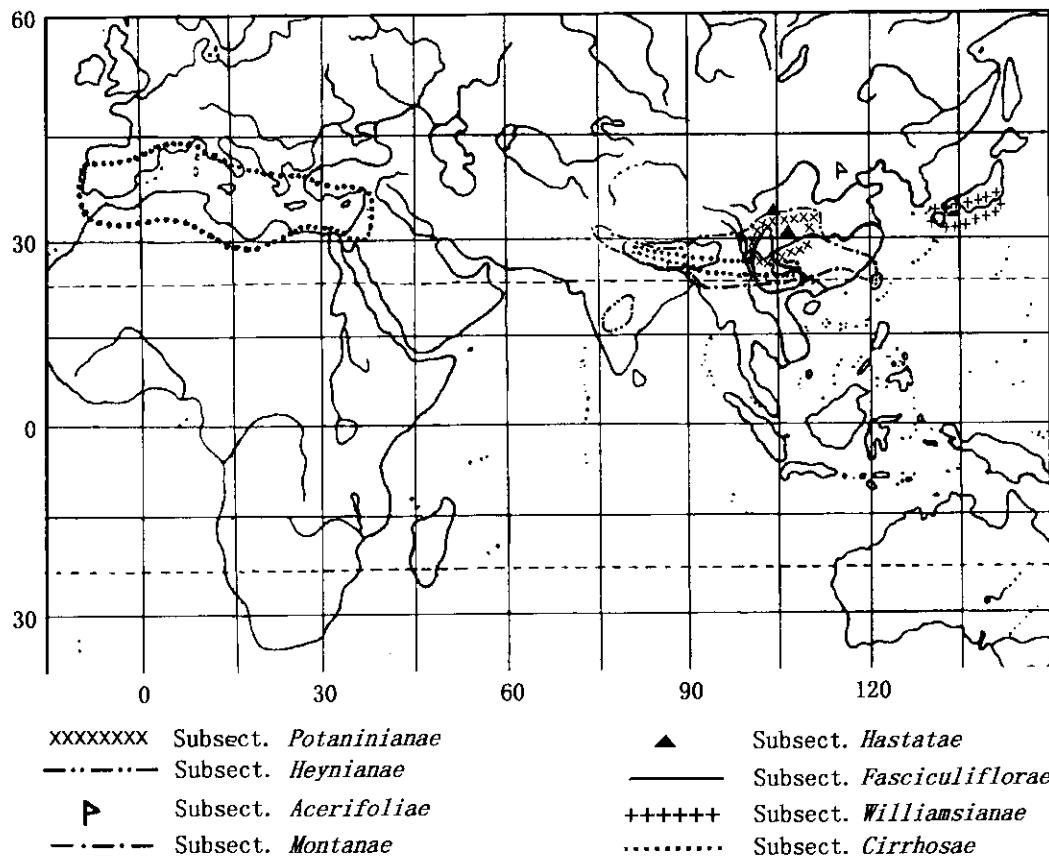

Fig. 2 Map showing the distribution of the eight subsections of the sect. *Cheiopsis*

Sect. *Flammula* DC. subsect. *Montanae* sensu Hand.-Mazz. in Acta Hort. Gotob. 13: 210. 1939, non Schneid.

Woody vines, seldom small erect shrubs. Seedling leaves alternate (known only in *C. montana*, *C. chrysocoma*, *C. napaulensis*, and *C. cirrhosa* —— Essig, 1991). Cauline leaves opposite, once or twice ternate or pinnate, rarely simple. Flowers bisexual, medium-sized, rarely large or small, in 1 ~ 3 (-many)-flowered, pedunculate, 2-bracteate cymes or pedicellate only, arising from leaf axils of hornotinous branch, or often alone or together with several leaves from an axillary bud of old branch. Sepals 4 (~ 5 ~ 8), petaloid, spreading, ascending, or nearly erect, white, rarely pink or purple, obovate, oblong, elliptic, lanceolate, or oblanceolate, inside glabrous, seldom puberulous, outside puberulous or velutinous, seldom glabrous, on the very margin puberulous or glabrous, seldom velutinous (*C. wenshanensis*). Stamens glabrous; filaments linear; anthers usually narrow-oblong, sometimes oblong or linear, at apex obtuse, seldom minutely apiculate. Achenes compressed, not or rarely rimmed at margin; persistent styles plumose.

22 species, in Asia, S Europe, N Africa.

Key to infrasectional taxa

1. Sepals spreading, valvate.
2. Flowers in pedunculate, 2-bracteate 1-3-flowered cymes arising from leaf axils of hornotinous branch; woody vines.
 3. Leaves once or twice pinnate; sepals obovate, 4 or 5 ~ 7; cymes 1 ~ 3-flowered; anthers oblong or narrow-oblong, at apex obtuse (Subsect. 1. **Potaniniaeae**).
 4. Leaves pinnate; cymes 1-flowered; sepals 4; ovaries pubescent 1. ***C. brevipes***
 4. Leaves bipinnate; cymes 1 ~ 3-flowered; sepals 5 ~ 7; ovaries glabrous 2. ***C. potaninii***
 3. Leaves ternate; sepals oblanceolate, 4; cymes 3-many-flowered; anthers linear, at apex minutely apiculate (Subsect. 2. **Heynianae**) 3. ***C. heynei***
 2. Flowers only pedicellate, 1 to several alone or with several leaves arising from an axillary bud of old branch, or rarely singularly or in pair from leaf axils of hornotinous branch.
 5. Small erect shrubs; leaves simple, palmately 5-lobed; sepals 5 ~ 8, narrowly obovate, glabrous (Subsect. **Acerifoliae**) 4. ***C. acerifolia***
 5. Woody vines; leaves ternate, rarely pinnate; sepals 4 (~ 6 ~ 8), at least outside hairy.
 6. Leaves more or less hairy, ternate, rarely pinnate; leaflets at margin usually dentate, seldom entire; sepals 4 (Subsect. 4. **Montanae**).
 7. Sepals obovate or broadly or narrowly obovate, at apex rounded or obtuse (Ser. 1. **Montanae**).
 8. Leaves ternate.
 9. Central leaflets 3-lobed or undivided.
 10. Leaflets whitish-puberulous; persistent styles whitish-plumose, only in *C. montana* var. *glabrescens* slightly fulvous-plumose; sepals 4.
 11. Leaflets ovate, narrow-ovate, or elliptic, seldom lanceolate, at margin dentate or denticulate, seldom entire; achenes broadly rhombic, broadly obovate or ovate, persistent styles 2 ~ 7 cm long 5. ***C. montana***
 12. Sepals outside appressed-puberulous; pedicels up to 5 ~ 13 cm long.
 13. Ovaries and achenes glabrous.
 14. Achenes broadly rhombic or broadly obovate, at apex acute; anthers narrow-oblong, up to 3 mm long.
 15. Leaflets ovate or elliptic, 2 ~ 7 cm × 1 ~ 5 cm, at margin dentate, often 2 ~ 3-lobed, sometimes undivided; flowers 3 ~ 5 cm in diam.; pedicels 3 ~ 12 cm long; persistent styles 2.5 ~ 4 cm long 5a. var. ***montana***

15. Leaflets smaller, elliptic, long elliptic, narrow-ovate, or lanceolate, 1~4 (~5) cm × 0.5 cm ~ 2 cm, at margin on each side 1 (~2)-dente or entire, undivided; flowers smaller, 1.5~4 cm in diam.; pedicels 1~4 cm long; persistent styles up to 2 cm long 5b. var. *sterilis*
14. Achenes ovate, at apex attenuate; anthers narrow-oblong or linear, 3~5.5 mm long.
16. Leaflets narrow-ovate or broadly lanceolate, 3.2~4.5 cm × 1~2 cm, at margin denticulate or entire, undivided; flowers 3.6~5.5 cm in diam.; pedicels 5~9.5 cm long; anthers narrow-oblong or linear, 3~4 mm long 5c. var. *angustifoliola*
16. Leaflets larger, ovate or narrow-ovate, 5.5~7 cm × 2~3 cm, at margin dentate, usually undivided; flowers larger, 6~9 cm in diam.; pedicels 7.5~13 cm long; anthers linear, 4.5~5.5 mm long 5d. var. *grandiflora*
13. Ovaries and achenes puberulous.
17. Flowers developing after leaves, 1.8~4.5 cm in diam. 5e. var. *brevifoliola*
17. Flowers developing before leaves, 1.6~3 cm in diam. 5f. var. *praecox*
12. Sepals outside along margin velutinous; pedicels usually longer, up to 18~24 cm long.
18. Sepals rose-pink, outside along margin thinly velutinous; pedicels 6.5~11 cm long; ovaries glabrous 5g. var. *rubens*
18. Sepals white, outside along margin very densely velutinous; pedicels up to 18~24 cm long.
19. Ovaries and achenes glabrous; persistent styles whitish-plumose.
20. Sepals obovate, at apex not emarginate.
21. Sepals at apex often mucronate (mucro ca. 1 mm long), without tail-like projection 5h. var. *longipes*
21. Sepals at apex each with a tail-like projection 5~10 mm long 5i. var. *urosepala*
20. Sepals narrow-obovate, at apex usually emarginate 5j. var. *wilsonii*
19. Ovaries and achenes puberulous; persistent styles slightly fulvous-plumose 5k. var. *glabrescens*
11. Leaflets lanceolate, at margin entire; achenes narrow-ovate, glabrous, persistent styles ca. 1 cm long 7. C. *venusta*
10. Leaflets yellowish-strigose; persistent styles fulvous-plumose; sepals 4 (~5~8); ovaries and achenes hairy 8. C. *chrysocoma*
9. Central leaflets 3-parted.
22. Leaflets adaxially puberulous; flowers 2~2.7 cm in diam.; sepals white, obovate-oblong, 11~15 mm × 4~6 mm 9. C. *tripartita*
22. Leaflets adaxially glabrous; flowers larger, 2.7~3.2 cm in diam.; sepals larger, purplish-red, obovate or narrow-obovate, 13~17 mm × 8~13.5 mm 10. C. *ningjingshanica*
8. Leaves pinnate, 5-foliate, occasionally a few 3-foliate, or sometimes nearly 2-pinnate 6. C. *gracilifolia*
23. Leaflets 2~3-lobed or undivided.
24. Ovaries and achenes glabrous.
25. Flowers 2~3.5 cm in diam.; anthers 1.6~2 mm long 6a. var. *gracilifolia*
25. Flowers 5~6.5 cm in diam.; anthers 2.8~3.2 mm long 6b. var. *macrantha*
24. Ovaries and achenes puberulous 6c. var. *lasiocarpa*
23. Leaflets 2~3-parted to 2~3-sect; ovaries and achenes glabrous 6d. var. *dissectifolia*
7. Sepals long elliptic, lanceolate, or oblanceolate, at apex acute, acuminate, or attenuate (Ser. 2. *Tongluenses*).
26. Sepals on the very margin not velutinous.
27. Sepals inside glabrous.

28. Flowers with leaves together arising from an axillary bud of old branch.
29. Leaflets long elliptic or lanceolate-oblong, at margin entire or 1~2-denticulate on each side; ovaries glabrous 11. *C. wallichii*
29. Leaflets ovate or elliptic, at margin dentate; achenes nearly glabrous 12. *C. manipurensis*
30. Branches glabrous 12a. var. *manipurensis*
30. Branches densely appressed-puberulous 12b. var. *lasioclada*
28. Flowers singularly or in pair arising from leaf axils of hornotinous branch; ovaries and achenes hairy.
31. Leaflets coriaceous or subcoriaceous, abaxially on veins sparsely puberulous; persistent styles ca. 3 cm long 13. *C. khasiana*
31. Leaflets papery, abaxially strigose; persistent styles 9~11 mm long 14. *C. laxistrigosa*
27. Sepals inside puberulous 15. *C. tongluensis*
32. Sepals outside glabrous 15a. var. *tongluensis*
32. Sepals outside densely appressed-puberulous 15b. var. *mollisepala*
26. Sepals outside on the very margin velutinous 16. *C. wenshanensis*
6. Leaves glabrous, pinnate, rarely ternate, leaflets at margin entire; branches glabrous; sepals 4 or 6, oblanceolate or obovate-oblong, at apex rounded (Subsect. 5. *Hastatae*).
33. Sepals 4 17. *C. hastata*
33. Sepals 6 18. *C. glabrifolia*
1. Sepals ascending or nearly erect, 4.
34. Flowers only pedicellate, not in bibracteate or involucrate cymes, 2~4 alone or with leaves arising from an axillary bud of old branch; sepals valvate, nearly erect; achenes lanceolate, glabrescent (Subsect. 6. *Fasciculiflorae*). 19. *C. fasciculiflora*
35. Leaflets narrow-ovate or lanceolate, 0.8~3.5 (~5) cm broad 19a. var. *fasciculiflora*
35. Leaflets linear-lanceolate, 3~6 (~10) mm broad 19b. var. *angustifolia*
34. Flowers in pedunculate, bibracteate or involucrate 1-flowered cymes, usually with leaves arising from axillary buds of old branch; achenes ovate or oblong-elliptic, more or less densely puberulous.
36. Cymes bibracteate; sepals imbricate, ascending, broadly ovate (Subsect. 7. *Williamsianae*) 20. *C. williamsii*
36. Cymes involucrate, rarely bibracteate; sepals valvate, nearly erect, oblong-obovate or oblong (Subsect. 8. *Cirrhosae*).
37. Leaves subcoriaceous or coriaceous, rarely papery, usually simple, undivided or 3-sect, seldom ternate (*C. cirrhosa* var. *balearica*); petioles shorter, 0.5~2.4 cm long 21. *C. cirrhosa*
38. Two opposite bracts connate into a involucre with a tube and two lobes.
39. Involucre campanulate, surrounding and covering pedicel and calyx base, on top indistinctly 2-lobed; pedicel 3~5 mm long, shorter than involucre.
40. Leaves simple, usually undivided 21a. var. *cirrhosa*
40. Leaves simple, variously divided, or ternate.
41. Leaves simple, 3-lobed to 3-sect, rarely undivided, their lobes at margin few-denticulate or entire 21b. var. *semitriloba*
41. Leaves simple, 3-sect, or ternate; leaflets or segments 2~3-parted, at margin incised-dentate 21c. var. *balearica*
39. Involucre not covering the pedicel and more or less separated from the calyx base, distinctly 2-lobed; pedicel (4~) 16~20 mm long, slightly or much longer than involucre.
42. Leaves simple, undivided or 3-lobed to 3-sect, at margin 1~2-denticulate or entire; cymes singularly arising from leaf axils of hornotinous branch; involucre 6 mm long, its lobes deltoid or ovate, 2.5~4 mm long; pedicel 4~20 mm long; anthers oblong, 1.2 mm long 22. *C. tenuiloba*

- 21d. var. **pedicellata**
42. Leaves simple, undivided, at margin densely, coarsely serrate; cymes 2 with leaves arising from a terminal bud of annotinous branch; involucre larger, 15 mm long, its lobes narrow-triangular or narrow-ovate, 9~10 mm long; pedicel ca. 16 mm long; anthers narrow-oblong, 3~3.4 mm long 21e. var. **barnadesii**
38. Two opposite bracts free, spreading 21f. var. **bibracteata**
37. Leaves herbaceous, ternate with undivided leaflets, seldom simple; petioles 3~7.5 cm long; cymes 1~3 with leaves arising from an axillary bud of old branch, with campanulate involucres 22. *C. napaulensis*

Subsect. 1. **Potaniniana** W. T. Wang in Acta Phytotax. Sin. 36(2):162. 1998, sphalm. *Potaniniana*, et 38(5): 401. et (6): 499. 2000. — Sect. *Clematis* subsect. *Potaniniana* M. Johnson, Klematis 410, 451. 1997, p. p. excl. *C. trichotoma* Nakai; Grey-Wils. Clematis 45. 2000, p. p. excl. *C. trichotoma* Nakai. TYPE: *C. potaninii* Maxim.

Woody vines. Leaves once or twice pinnate. Flowers in pedunculate, 2-bracteate, 1~3-flowered cymes arising from leaf axils of hornnotinous branch. Sepals 4~7, valvate, spreading, obovate or narrow-obovate, at apex rounded. Anthers oblong or narrow-oblong, at apex obtuse.

2 species, endemic to SW China.

1 短梗铁线莲 Fig. 3: 4~5

Clematis brevipes Rehd. in J. Arn. Arb. 9: 39. 1828; Hand.-Mazz. in Acta Hort. Gotob. 13: 190. 1939; M. Johnson, Klematis 387. 1997; Grey-Wils. Clematis 79. 2000. TYPE: China. Gansu (甘肃), Between Kaichow and Minchow, 1925-04, Rock 12075 (holotype, GH!; isotypes, K!, P!, S!).

Woody vine. Branches very shallowly 4-sulcate, glabrous or only on nodes sparsely puberulous; branchlets densely puberulous. Leaves pinnate, 5-foliolate; leaflets papery, broad-ovate or broad-rhombic, 1.5~4 cm × 0.7~3 cm, at apex acute, at base subtruncate or broadly cuneate, 3-lobed to 3-parted, central lobe subrhombic, at margin on each side 1-dentate, lateral lobes obliquely cuneate, unequally 2-lobulate or undivided, adaxially on slightly impressed veins sparsely puberulous, abaxially on veins pubescent, basal veins nearly flat; petioles 3.6~5 cm long, puberulous. Cymes axillary, 1-flowered; peduncles 2.5~6 mm long, puberulous; bracts narrow-lanceolate, 2~4 mm long, puberulous. Flower ca. 3 cm in diam.; pedicel 0.6~1.5 cm long, puberulous. Sepals 4, white, broad-obovate, orbicular-rhombic, or broad-elliptic, 1.2~1.8 cm × 1~1.5 cm, at apex rounded, inside glabrous, outside appressed-puberulous. Stamens 8~10 mm long, glabrous; anthers oblong or narrow-oblong, 1.6~2 mm long, at apex obtuse. Ovaries pubescent; styles ca. 8 mm long, densely villous. Fl. Apr.

China (S Gansu). Only known from the type specimens.

Johnson, Klematis 432. 1997; Grey-Wils. Clematis 37. 2000. TYPE: E India. Type specimen not seen. Fig. 3: 6 ~ 7

Woody vine. Branches nearly not or very shallowly 8 ~ 10-sulcate, densely appressed-puberulous, glabrescent. Leaves ternate, upper ones sometimes simple; leaflets papery, narrowly to broadly ovate, 1.2 ~ 3.6 (~ 7) cm × 1 ~ 3.6 (~ 7) cm, at apex acute, at base rounded, subtruncate, or broadly cuneate, at margin entire, undivided or 2 ~ 3-lobed, on both surfaces appressed-puberulous, basal veins abaxially slightly prominent; petioles 2.5 ~ 7 cm long. Cymes axillary and terminal, 3-many-flowered; peduncles 2 ~ 6 cm long, with pedicels densely pubescent; bracts petiolate, ovate, 1.8 ~ 3 cm long or foliaceous. Flower 2.5 ~ 3.6 cm in diam.; pedicel 2.8 ~ 4.5 cm long. Sepals 4 ~ 6, white, oblanceolate, seldom oblong-lanceolate, 13 ~ 21 mm × 4 ~ 7 mm, at apex rounded, obtuse, or acute, mucronate, inside glabrous, outside sericeous, on margin puberulous or sometimes glabrous. Stamens 5 ~ 8 mm long, glabrous; anthers linear, 3 ~ 3.8 mm long, at apex minutely apiculate. Ovaries densely pubescent; styles ca. 6 mm long, densely villous. Achenes compressed, narrow-elliptic, 3 ~ 4 mm × 1.5 ~ 2 mm, appressed-pubescent; persistent styles ca. 2.4 cm long, plumose. Fl. Oct. ~ Nov.

India (Madhya Pradesh, Maharashtra, Karnataka). On slopes; up to 500 m.

Specimens examined. India. Pachmarhi, Hole 1969 (GH), Haines 2907 (K); Maharashtra, Janardhanan 72888 (K), Hamddri 104271 (BM); Konkan, Law s. n. (K), Stocks & Law s. n. (K); Decan Hills, Gibson s. n. (K).

Subsect. 3 **Acerifoliae** W. T. Wang in Acta Phytotax. Sin. 36(2): 101. 1998 et 38(6): 499. 2000. TYPE: *C. acerifolia* Maxim.

Small erect shrubs. Leaves simple, palmately 5-lobed. Flowers 2 alone or with leaves arising from an axillary bud of uppermost leaf, pedicellate only, without peduncle and bracts. Sepals 5 ~ 8, valvate, spreading, narrow-obovate, glabrous. Anthers oblong or narrow-oblong, at apex obtuse.

1 species, endemic in Beijing, N China.

The simple, palmately divided leaves of *C. acerifolia*, as those of *C. ranunculoides* Franch. (sect. *Viorna* subsect. *Connatae*) and *C. trifida* Hook (sect. *Pseudanemone*) are typical in the Ranunculaceae, and rare in the genus *Clematis*.

The glabrous sepals are curious in the *Clematis*, and in it there are only two species, *C. acerifolia* Maxim. and *C. sichotealinensis* Ulan (sect. *Clematis* sect. *Rectae*) with glabrous sepals (Wang, 2000b). In other species of the *Clematis*, the sepals are usually outside variously hairy, inside glabrous and sometimes on both surfaces hairy.

C. montana is wide-spread in Asian subtropical montane regions and variable in leaf, flower and fruit morphology. In the present revision, are recognized ten varieties of it, of which most are concentrated in Southwest China and the Himalayas, and only var. *montana* extends from Southwest China eastwards to the Taiwan Island of China.

5a Var. *montana* Fig. 4: 3 ~ 5

Woody vine. Branches terete, often shallowly 4 ~ 10-sulcate, puberulous, often glabrescent. Leaves ternate; leaflets papery or herbaceous, ovate, rhombic-ovate, or elliptic, 2 ~ 7 cm × 1 ~ 5 cm, at apex acuminate, at base broadly cuneate or rounded, at margin sparsely dentate, occasionally entire, undivided, or 2 ~ 3-lobed, on both surfaces sparsely puberulous, basal veins abaxially nearly flat; petioles 2.5 ~ 9 cm long. Flowers (1 ~) 2 ~ 4 (~ 6) with several leaves arising from an axillary bud of old branch, 3 ~ 5 cm in diam.; pedicels 3 ~ 10 cm long, sparsely puberulous. Sepals 4, white, obovate, 1.3 ~ 3 cm × 0.8 ~ 1.5 cm, at apex rounded, inside glabrous, outside appressed-puberulous. Stamens 6 ~ 10 mm long, glabrous; anthers narrow-oblong, (1.5 ~) 2 ~ 3 mm long, at apex obtuse. Ovaries glabrous; styles 5 ~ 7 mm long, densely villous. Achenes strongly compressed, broadly rhombic or rhombic-ovate, 4 ~ 5 mm × 3 ~ 4 mm, at apex acute, glabrous; persistent styles 2.5 ~ 4 cm long, plumose. Fl. Apr. - Jun.

Afghanistan. Bangladesh. Bhutan. China (S Anhui, N W Fujian, S Gansu, N Guangxi, Guizhou, S W Henan, Hubei, Hunan, Jiangxi, S Ningxia, S Qinghai, S Shaanxi, Sichuan, Taiwan, S Xizang, Yunnan, Zhejiang). N India. Kashmir. N Myanmar. Nepal. N Pakistan. In bushes or forests, at forest margins, or by streams; 1200 ~ 4000 m.

Myanmar. Miyitkyina, Kermode 17268 (K).

5i Var. **urosepala** W. T. Wang in Acta Phytotax. Sin. 38 (6): 500, fig. 2: 1. 2000. TYPE: Myanmar. Tama Bum, 3000 m, 1953-06-20, F. Kingdon Ward 21038 (holotype, GH!).

Leaflets rhombic-ovate, 4 ~ 8 cm × 3 ~ 5 cm, at apex long acuminate, at margin incised-dentate, 2 ~ 3-lobed. Flowers developing after leaves, 4.5 ~ 5 cm in diam.; pedicels 19 ~ 21 cm long. Sepals white, narrow-obovate, at apex rounded, with a tail-like projection 5 ~ 10 mm long, outside along margin on each side with a broad strip of densely velutinous indumentum. Anthers narrow-oblong, 2.5 ~ 3 mm long. Achenes unknown.

N Myanmar.

5j 晚花绣球藤 Fig. 7: 1 ~ 2

Var. **wilsonii** Sprague in Curtis, Bot. Mag. 137: t. 8365. 1911; Rehd. & Wils. in Sarg. Pl. Wils. 1: 333. 1913; Hand.-Mazz. in Acta Hort. Gotob. 13: 210. 1939; M. C. Chang in Fl. Reip. Pop. Sin. 28: 323. 1980, p. p. excl. syn.; C. Y. Wu, Ind. Fl. Yunnan. 1: 112. 1984; M. Johnson, Klematis 402. 1997; Grey-Wils. Clematis 86. 2000. TYPE: t. 8365, l. c.

Leaflets ovate, 3 ~ 8 cm × 2 ~ 5.2 cm, at apex acuminate, at margin coarsely dentate, usually 2 ~ 3-lobed. Flowers developing after leaves, 3.5 ~ 6 cm in diam.; pedicels 6 ~ 20 cm long. Sepals white, narrow-obovate, at apex often emarginate, outside along margin on each side with a broad strip of grey densely velutinous indumentum. Anthers narrow-oblong, 2.2 ~ 3.2 (~ 4) mm long, at apex minutely apiculate. Achenes broadly rhombic or broadly rhombic-obovate, ca. 3.5

$\text{mm} \times 3.2 \text{ mm}$, glabrous; persistent styles ca. 4.5 cm long. Fl. Jul. – Aug.

China (W Sichuan, SE Yunnan). In bushes or forests, at forest edges, or on grassy slopes; 2300 ~ 2800 m.

This variety was described from cultivated plant introduced by E. H. Wilson from Central China, and no type specimen was designated. In this case, the original coloured table accompanying the original description may be served as the nomenclatural type according to Article 8 of ICBN (Greuter *et al.* 2000).

Specimens examined. **China. Sichuan** (四川): Leibo (雷波), Econ. Pl. Exped. 59-990, 59-8674, Q. S. Zhao 1295 (PE); Hongxi (洪溪), Econ. Pl. Exped. 59-1284, Z. T. Guan 7455 (PE); Ebian (峨边), Z. T. Guan 6617 (PE); Emeishan (峨眉山), W. P. Fang 2838 (K, P), K. C. Kuan *et al.* 4107, Sichuan Exped. 73-138 (PE); Baoxing (宝兴), E. H. Wilson 868a (E, K); without precise locality, W. P. Fang 6651, 7679, 8193 (PE). **Yunnan** (云南): Mengzi (蒙自), Henry 10748 (GH).

5k 毛果绣球藤 Fig. 6: 4 ~ 6

Var. *glabrescens* (Comb.) W. T. Wang & M. C. Chang in Acta Bot. Yunnan. 15 (4): 351. 1993; W. T. Wang in Fl. Yunnan. 11: 230. 2000. — *C. chrysocoma* Franch. var. *glabrescens* Comb. in Not. R. Bot. Gard. Edinb. 18: 234. 1934; Hand. – Mazz. in Acta Hort. Gotob. 13: 211. 1939; C. Y. Wu, Ind. Fl. Yunnan. 1: 107. 1984; M. Johnson, Klematis 390. 1997. TYPE: China. C. montana var. *trifoliolata* M. Johnson, Klematis 393, cum fig. 1997. TYPE: China. Sichuan (四川), Kangding (康定), Yulingkuang, 1935-10-19, H. Smith 12580 (holotype, UPS, not seen).

Consisting of four varieties endemic to SW China.

6a Var. *gracilifolia* Fig. 7: 3~4

Woody vine. Branches shallowly 4~6-sulcate, appressed-puberulous, glabrescent. Leaves usually pinnate, 5-foliolate, seldom ternate; leaflets thin-papery or herbaceous, ovate, narrow-ovate, broad-ovate, or obovate, 0.5~3.5 cm × 0.3~3 cm, at apex acute, at base cuneate or rounded, at margin sparsely serrate or denticulate, undivided or 2~3-lobed, on both surfaces sparsely puberulous, basal veins nearly flat; petioles 1.5~7.5 cm long. Flowers 1~5 with several leaves arising from an axillary bud of old branch, 2~3.5 cm in diam.; pedicels 3~6.5 cm long, sparsely puberulous. Sepals 4, white or outside tinged with pinkish, obovate, 0.9~1.8 cm × 0.4~1.1 cm, at apex rounded, inside glabrous, outside appressed-puberulous. Stamens 5.5~8 mm long, glabrous; anthers narrow-oblong, 1.6~2 mm long, at apex obtuse. Ovaries glabrous; styles 5~6 mm long, densely villous. Achenes strongly compressed, broadly ovate, 4~4.5 mm × 3.2~3.8 mm, glabrous; persistent styles 1.5~2.2 cm long, plumose. Fl. Apr.~Jun.

China (S Gansu, W Sichuan, E Xizang, NW Yunnan). In forests or by streams; 2000~3800 m.

Additional specimens examined. **China. Gansu** (甘肃): Zhouqu (舟曲), T. P. Wang 15140 (PE); Minxian (岷县), Rock 12428 (GH, K, P, S), 12469 (GH, UPS), T. P. 6b 大花薄叶铁线莲

Var. *macrantha* W. T. Wang & M. C. Chang in Fl. Reip. Pop. Sin. 28: 359. 1980; M. Johnson, Klematis 393. 1997; Grey-Wils. Clematis 80. 2000. TYPE: China. Sichuan (四川), Baoxing (宝兴), Denglonggou (灯笼沟), 1954-06-06, T. P. Soong 38390 (holotype, NAS!; isotype, PE!).

Leaflets undivided or 2 ~ 3-lobed. Flowers 5 ~ 6.5 cm in diam. Stamens 7 ~ 14 mm long; anthers 2.8 ~ 3.2 mm long. Ovaries and achenes glabrous. Fl. Jun.

China (W Sichuan).

Additional specimens examined. **China. Sichuan** (四川): Lixian (理县), Z. He 12843 (PE).

6c 毛果薄叶铁线莲

Var. *lasiocarpa* W. T. Wang in Acta Phytotax. Sin. 38(6): 501. 2000. TYPE: China. Xizang (西藏), Lhunze (隆子), Jiayu (加玉), 1975-07-03, Qinghai-Xizang Exped. 75-446 (holotype, PE!).

Leaflets undivided. Ovaries and achenes puberulous. Fl. Jul.

China (SE Xizang). In bushes on slopes; 3500 m.

6d 狹裂薄叶铁线莲

Var. *dissectifolia* W. T. Wang & M. C. Chang in Fl. Reip. Pop. Sin. 28: 359. 1980; M. Y. Fang in Fl. Xizang. 2: 91. 1985; L. Q. Li in Vasc. Pl. Hengduan Mount. 1: 530. 1993; M. Johnson, Klematis 392. 1997; Grey-Wils. Clematis 79, fig. 39. 2000. TYPE: China. Sichuan (四川), Muli (木里), 2800 m, 1937-06-16, T. T. Yu 6308 (holotype, PE!); Yajiang (雅江), 4000 m, 1974-09-17, C. C. Wang 5021 (paratype, PE!).

Leaflets 2 ~ 3-parted to 2 ~ 3-sect. Flowers 1.5 ~ 2.3 cm in diam. Stamens 7 ~ 9 mm long;

anthers 2~3 mm long. Ovaries and achenes glabrous. Fl. May~Jun.

China (W Sichuan, E & S Xizang). In bushes or on slopes; 2800~4000 m.

Additional specimens examined. **China. Sichuan** (四川): Muli (木里), T. T. Yu 6223 (PE); Kangding (康定), S. Jiang 2863, 1974, Q. Q. Wang 4427 (PE); Qianning (乾宁), Sichuan Exped. 5378 (PE). **Xizang** (西藏): Markam (芒康), Qinghai-Xizang Exped. 76-8145 (PE); Nyingchi (林芝), J. W. Zhang & J. T. Wang 12 (PE); Nyalam (聂拉木), Y. T. Zhang & K. Y. Lang 3156, 3502 (PE).

7 丽叶铁线莲 Fig. 8: 1~2

Clematis venusta M. C. Chang in Fl. Reip. Pop. Sin. 28: 218, 358, fig. 32. 1980; C. Y. Wu, Ind. Fl. Yunnan. 1: 114. 1984; L. Q. Li in Vasc. Pl. Hengduan Mount. 1: 528. 1993; M. Johnson, Clematis 406. 1997; Grey-Wils. Clematis 81, fig. 41. 2000; W. T. Wang in Fl. Yunnan. 11: 232. 2000. TYPE: China. Yunnan (云南), Weixi (维西), Yezhi (叶枝), 1940-05-14, K. M. Feng 3851 (holotype, KUN, not seen; photo, PE!); same locality, 1940-05-16, K. M. Feng 4134 (paratype, KUN, not seen; isoparatype, PE!).

Woody vine. Branches nearly terete, not or very shallowly 8-sulcate, glabrous. Leaves ternate; leaflets papery, lanceolate or narrow-ovate, 2.5~7 cm × 0.8~2 cm, at apex attenuate, at base cuneate or broadly cuneate, at margin entire, seldom 1~2-denticulate, adaxially subglabrous or glabrescent, abaxially sparsely appressed-puberulous, basal veins abaxially nearly flat; petioles 1.5~5.2 cm long, sparsely pilose. Flowers 1~5 with about 2 pairs of leaves arising from an axillary bud of old branch, (3~) 5~8 cm in diam.; pedicels 4~15 cm long, sparsely puberulous. Sepals 4, white or pinkish, spreading, broad-elliptic or obovate-elliptic, (1.5~) 2.5~4 cm × (~6) 2~2.5 cm, at apex rounded, rounded-obtuse, or emarginate, inside glabrous, outside sparsely but near margin densely appressed-puberulous. Stamens 8~14 mm long, glabrous; anthers linear or narrow-oblong, (2~) 2.5~3 mm long, at apex obtuse. Ovaries glabrous or at base pubescent; styles ca. 7 mm long, densely villous. Achenes strongly compressed, narrow-ovate, ca. 7 mm × 3.5 mm, glabrous, slightly tumidly marginate, on both surfaces with 2 longitudinal thin ribs; persistent styles ca. 1 cm long, brownish-plumose. Fl. May.

China (SW Sichuan, NW Yunnan). In mixed forests or bushes by streams; 2300~3100 m.

Additional specimens examined. **China. SW Sichuan** (四川西南部): without precise locality, E. H. Wilson 2460 (K). **Yunnan** (云南): Lijiang (丽江), Yulongshan (玉龙山), SW China Exped. 65-164 (PE); Lijiang, Ludian (鲁甸), ?62-720 (PE); Zhongdian (中甸), Qiaotou (桥头), Zhongdian Exped. 63-3030 (IMD); Dêqên (德钦), Tsekou, Soulue 1494, Monbeig s. n. (K); without precise locality, Delavay s. n. (G, K), Forrest 10194 (K).

Woody vine, sometimes nearly erect. Branches shallowly 8-sulcate, glabrescent. Leaves ternate; leaflets papery, rhombic-obovate or rhombic-ovate, 2~6 cm × 1.5~4.5 cm, at apex acute or acuminate, at base broadly cuneate, at margin few-dentate, adaxially more or less densely appressed-pubescent, abaxially densely yellowish-strigose, basal veins nearly flat; petioles 1~6.5 cm long. Flowers 1~6 with several leaves arising from an axillary bud of old branch or singularly born in leaf axils of hornotinous branch, 3.2~6 cm in diam.; pedicels 4.5~8.5 (~20) cm long, densely puberulous. Sepals 4 (~5~8), pink or white, obovate or elliptic-obovate, 1.6~3 cm × 0.8~2 cm, at apex obtuse or rounded, inside glabrous, outside appressed-puberulous, along margin velutinous. Stamens 6~11 mm long, glabrous; anthers narrow-oblong, 3~4 mm long, at apex obtuse. Ovaries pubescent; styles ca. 7 mm long, densely villous. Achenes compressed, ovate, 4~5 mm × 2~3 mm, pubescent; persistent styles 2.2 cm ~ 2.7 cm long, fulvous-plumose. Fl. Apr. - Jul.

China (W Guizhou, W Sichuan, NW C & E Yunnan). In bushes by streams, on grassy, dry or stony slopes; 1000~3000 m.

9 深裂铁线莲

Clematis tripartita W. T. Wang in Acta Phytotax. Sin. 38(6): 500, fig. 2: 3 ~ 4. 2000.
TYPE: China. Xizang (西藏), Nyalam (聂拉木), 4000 m, 1990-06-09, Sino-Japan. Exped. T450 (holotype, PE!); same locality, 3000 m, 1990-06-06, Sino-Japan. Exped. T325 (paratype, PE!). Nepal. Lantang Valley, 3780 m, 1965-06-25, Schilling, Saywo & Bista 400 (paratype, K!).

Woody vine. Branches 1.8 ~ 3 mm in diam., shallowly 6 ~ 10-sulcate, glabrous. Leaves ternate; leaflets thickly papery or coriaceous, terminal ones broad-rhombic, 6 ~ 15 mm × 6 ~ 14 mm, at apex acute, at base broadly cuneate, nearly to base 3-parted, lobes rhombic, 3-lobatae, lateral leaflets smaller, obliquely ovate, unequally 2 ~ 3-lobulate, lobes usually 1 ~ 2-denticulate, on both surfaces appressed-puberulous, basal veins abaxially nearly flat; petioles 1 ~ 1.8 cm long, puberulous. Flowers 1 ~ 6 with about 2 pairs of leaves arising from an axillary bud of old branch, 2 ~ 2.7 cm in diam; pedicels slender, 2.8 ~ 4 cm long, densely puberulous. Sepals 4, white, obovate-oblong or oblong, 11 ~ 15 mm × 4 ~ 6 mm, at apex rounded or obtuse, often mucronate, inside glabrous, outside appressed-puberulous. Stamens 4 ~ 7 mm long glabrous; anthers narrow-oblong or sublinear, 2 ~ 2.2 mm long, at apex obtuse. Ovaries pubescent; styles ca. 5 mm long, densely villous, at apex circinate recurved. Fl. Jun.

China (S. Xizang). Nepal. On slopes, at moraine edges, or on Berberis bushes; 3000 ~ 4000 m.

10 宁静山铁线莲 Fig. 8: 3 ~ 4

Clematis ningjingshanica W. T. Wang in Acta Phytotax. Sin. 39(4): 310, fig. 1: 4 ~ 6. 2001. TYPE: China. Xizang (西藏), Ningjingshan (宁静山), Yanjing (盐井), 1961-06-07, P. K. Hsiao et al. 1128 (holotype, PE!).

Woody vine. Branches subterete, not sulcate, smooth, only on nodes sparsely puberulous, elsewhere glabrous, minutely lineate; bud scales coriaceous, triangular, 4 ~ 5 mm long. Leaves ternate; leaflets coriaceous, terminal ones petiolulate, rhombic-ovate, ca. 1.4 cm × 1.2 cm, at apex acute, at base broadly cuneate, 3-parted, central lobe narrow-rhombic, narrowly 3-lobulate, lateral lobes obliquely narrow-oblong, 1-denticulate, adaxially glabrous, abaxially on midrib pilose, lateral leaflets smaller, subsessile, obliquely narrow-ovate, ca. 12 mm × 8 mm, 3-lobed, at margin entire, basal veins nearly flat; petioles 1 ~ 1.3 cm long, sparsely pilose. Flowers 1 ~ 3 with 1 ~ 2 pairs of leaves arising from an axillary bud of old branch, 2.7 ~ 3.2 cm in diam.; pedicels 2 ~ 3 cm long, puberulous. Sepals 4, purple-red, obovate or narrow-obovate, rarely elliptic, 1.3 ~ 1.7 cm × 0.8 ~ 1.3 cm, at apex rounded, inside glabrous, outside sparsely appressed-puberulous, sometimes on central part with some longer hairs. Stamens 6 ~ 11 mm long, glabrous; anthers linear, 2 ~ 2.8 mm long, at apex obtuse. Ovaries glabrous; styles ca. 7 mm long, densely villous. Fl. Jun.

China (E Xizang: Mt. Ningjingshan).

Ser. 2 **Tongluenses** W. T. Wang in Acta Phytotax. Sin. 38(6): 501. 2000. TYPE: *C. tongluensis* (Bruhl) Tamura.

Sepals long elliptic, oblong, lanceolate, or oblanceolate, at apex acute, acuminate, or attenuate. Anthers usually linear.

6 species. Distributed in Bangladesh, Bhutan, China (SW Sichuan, SE Xizang, SE Yunnan), NE India, N Myanmar, E Nepal, Sikkim.

11 Clematis wallichii W. T. Wang in Acta Phytotax. Sin. 39(1): 2, fig. 1: 1~2. 2001. TYPE: India. Kumaon, Wallich 4681B (holotype, K!; isotype, BM!). — *C. montana* DC. ssp. *normalis* Kuntze var. *edentata* Kuntze in Verh. Bot. Ver. Brand. 26: 141. 1885, non *C. edentata* Baker, 1884. TYPE: Himalaya, Wallich s. n. (holotype, B, not seen).

Fig. 4: 1~2

Woody vine. Branches subterete, indistinctly longitudinally striate, glabrous. Leaves ternate; leaflets papery, terminal ones oblong or lanceolate-oblong, (2~) 3.4~4.2 cm × (0.7~) 1.1~1.3 cm, at apex acuminate or attenuate, at base cuneate, at margin entire or 1-denticulate on each side, lateral leaflets smaller, narrow-ovate, lanceolate, or elliptic, (1.5~) 2~3 cm × (0.6~) 0.9~1.2 cm, adaxially subglabrous, abaxially on nearly flat basal veins sparsely puberulous, on margin ciliolate; petioles slender, 0.5~5 cm long, very sparsely puberulous. Flowers ca. 2 with about 3 pairs of leaves arising from an axillary bud of old branch, ca. 4 cm in diam.; pedicels 10.6~11 cm long, subglabrous. Sepals 4, oblanceolate or obovate-oblong, 2.1~2.2 cm × 0.6~0.8 cm, at apex acute, mucronate, inside glabrous, outside along margin densely appressed-puberulous. Stamens 6~9 mm long, glabrous; anthers narrow-oblong or sublinear, 2.8~3.8 mm long, at apex obtuse. Ovaries glabrous; styles ca. 7 mm long, densely villous. Achenes compressed, orbicular-ovate, ca. 3 mm × 3 mm, glabrous; persistent styles ca. 2 cm long, plumose. Fl. May.

N India. W Nepal. In montane regions; ca. 2300 m.

Additional specimens examined. **India**. Kumaon: Nynee Tal, Thomson 550 (BM).

Nepal. Bauli, Dobremez 2048 (BM).

12 Clematis manipurensis (Bruhl) W. T. Wang in Acta Phytotax. Sin. 38(6): 501. 2000. — *C. montana* DC. var. *manipurensis* Bruhl in Ann. Bot. Gard. Calc. 5(2): 74, pl. 103, fig. 3. 1896. — *C. montana* ssp. *normalis* Kuntze var. *manipurensis* Bruhl ex Gupta in Bull. Nat. Bot. Gard. Lucknow 80: pl. 36. 1963. — *C. montana* ssp. *montana* var. *manipurensis* Bruhl ex Kapoor in Bull. Nat. Bot. Gard. Lucknow 124: 47, cum deser. ampla. 1966; Rau in Sharma et al. Fl. Ind. 1: 71. 1993; M. Johnson, Klematis 401. 1997; Grey-Wils. Clematis 85. 2000. TYPE: India. Manipur, Watt 6439 (isosyntypes, E!, P!); Naga Hills, Colomb s. n. (syntype, not seen).

12a Var. *manipurensis* Fig. 9: 1~2

Woody vine. Branches indistinctly shallowly sulcate, glabrous. Leaves ternate; leaflets papery, ovate, rhombic-ovate, subelliptic, or narrow-obovate, 2~8 cm × 1~4 cm, at apex acuminate or acute, at base broadly cuneate or subrounded, at margin dentate, 2~3-lobulate or 2~3-lobed, or undivided, on both surfaces sparsely pubescent, usually more densely on veins, basal veins abaxially nearly flat; petioles 1.5~8 cm long. Flowers usually 1~3 with about 2 pairs of leaves arising from an axillary bud of old branch or the top of an abbreviated branch, 3.8~5 cm in diam.; pedicels 6~14 cm long, pubescent. Sepals 4, narrowly elliptic-oblong, 1.8~3.5 cm × 0.5~1.1 cm, at apex attenuate, inside glabrous except the puberulous tip, outside densely

Fig. 9 1,2. *Clematis manipurensis* (Bruhl) W. T. Wang var. *manipurensis* 1. Flowering branch; 2. Stamen (from watt 6439). 3,4. *C. tongluensis* (Bruhl) Tamura var. *tongluensis* 3. Fig. 9: 5~6

Woody vine. Branches terete, very shallowly 8-sulcate, sparsely puberulous, glabrescent. Leaves ternate; leaflets coriaceous or subcoriaceous, broadly ovate, ovate, or elliptic, 1.3~5.5 cm×0.5~3.5 cm, at apex acute or acuminate, at base rounded or broadly cuneate, at margin few-dentate, undivided or 2~3-lobulate, on both surfaces on veins sparsely puberulous, basal veins abaxially prominent; petioles 1.3~4.2 cm long, sparsely puberulous. Flowers singularly arising from leaf axils of hornotinous branch; pedicels 5~14.2 cm long, puberulous. Sepals 4, white, narrowly elliptic-oblong or obovate-oblong, 2.6~3.5 cm×1~1.7 cm, at apex acute, inside glabrous, outside sparsely puberulous, along margin velutinous. Stamens 6~10 mm long, glabrous; anthers linear, 3.2~4 mm long, at apex minutely apiculate. Ovaries pubescent; styles ca. 7 mm long, densely villous. Achenes compressed, broad-ovate or obovate, 4~5 mm×2 mm, pubescent; persistent styles ca. 3 cm long, plumose. Fl. Apr.~May.

India (Assam: Khasi & Jaintia Hills). In montane regions; 1825 m.

Specimens examined. **India**. Assam, 1893-05, King’s collector (G).

Khasia. J. D. Hooker & Thomson s. n. (K), Clarke 43796A (BM).

14 糙毛铁线莲 Fig. 5: 1~2

Clematis laxistrigosa (W. T. Wang & M. C. Chang) W. T. Wang in Fl. China 6: 345. 2001. —— *C. chrysocoma* Franch. var. *laxistrigosa* W. T. Wang & M. C. Chang in Acta Bot. Yunnan. 15: 352. 1993; Grey-Wils. Clematis 78. 2000. TYPE: China. Sichuan (四川), Hanyuan (汉源), 1939-09-08, T. P. Wang 9614 (holotype, PE!); same locality, Xianglingshan (祥岭山), T. P. Wang 9551 (paratype, PE); same locality, W. P. Fang 9006 (paratype, PE!); Ganluo (甘洛), Liangshan Exped. 59-4544 (paratype, PE!).

C. chrysocoma Franch. var. *glabrescens* auct. non Comb.: M. C. Chang in Fl. Reip. Pop. Sin. 28: 220. 1980.

Woody vine. Branches subterete, shallowly 8-sulcate, puberulous. Leaves ternate; leaflets

chartaceous, rhombic, narrowly rhombic, or ovate, rarely long elliptic, $1.5 \sim 4.8 \text{ cm} \times 1 \sim 3.5 \text{ cm}$, at apex acute or shortly acuminate, at base broadly cuneate or subrounded, at margin above the middle few-dentate, seldom entire, adaxially sparsely pubescent, abaxially strigose, basal veins abaxially slightly prominent; petioles $2.2 \sim 4 \text{ cm}$ long. Flowers singularly or in pair arising from leaf axils of hornotinous branch, $5 \sim 5.6 \text{ cm}$ in diam.; pedicels $5.8 \sim 9.5 \text{ cm}$ long, appressed-puberulous. Sepals 4, white, narrow-elliptic, obovate-oblong, or narrow-obovate, $(2 \sim) 2.6 \sim 3 \text{ cm} \times 1 \sim 1.3 \text{ cm}$, at apex acute or shortly acuminate, inside glabrous, outside on basal veins appressed-puberulous and along margin velutinous. Stamens $6 \sim 8.5 \text{ mm}$ long, glabrous; anthers linear, $3.5 \sim 3.8 \text{ mm}$ long, at apex obtuse. Ovaries densely puberulous; styles ca. 6 mm long, densely villous. Achenes compressed, ovate or broadly ovate, $2 \sim 2.5 \text{ mm} \times 2 \sim 2.2 \text{ mm}$, puberulous; persistent styles $9 \sim 11 \text{ mm}$ long, plumose. Fl. Aug. – Sept.

China (SW Sichuan). On slopes, by streams, or scrambling on small trees; 1170 ~ 2800 m.

Sepals outside densely appressed-puberulous.

China (SE Xizang). In thickets; 2800 m.

16 文山铁线莲 Fig. 8: 5~6

Clematis wenshanensis W. T. Wang in Acta Phytotax. Sin. 39(4): 313, fig. 2: 3~4. 2001. TYPE: China. Yunnan (云南), Wenshan (文山), Laojunshan (老君山), village Leshichong (乐诗冲乡), 2650 m. 1993-05-07, Y. M. Shui 2714 (holotype, PE!); same locality, Xiaoyantou (啸岩头), 2430 m, 1993-03-31, Y. M. Shui 1825 (paratype, PE!).

Woody vine. Branches subterete, indistinctly 10-sulcate, glabrous. Leaves ternate; leaflets papery, ovate or narrow-ovate, 3.5~7 cm × 1.8~3 cm, at apex acuminate or long acuminate, at base rounded, at margin dentate, undivided or sometimes the lateral leaflets 2-lobulate, adaxially on veins very sparsely puberulous, abaxially sparsely appressed-puberulous, basal veins nearly flat; petioles 2.4~4 cm long. Flowers usually 2 together with 2 pairs of leaves arising from an axillary bud of old branch, 6.5~7 cm in diam.; pedicels 9~11 cm long, very sparsely puberulous. Sepals 4, white, ovate-oblong, 3.3~3.7 cm × 1.1~1.6 cm, at apex attenuate, shortly cuspidate, inside glabrous, outside subglabrous, on the very margin velutinous. Stamens 7~14 mm long, glabrous; anthers linear or narrow-oblong, 2.5~3 mm long, at apex obtuse. Ovaries glabrous; styles 8~11 mm long, densely villous. Fl. Apr.~May.

China (SE Yunnan). Scrambling on forests or in bamboo thickets; 2430~2650 m.

In the sect. *Cheiopsis*, *C. wenshanensis* is unique in its sepals with narrow strip of velutinous indumentum on the very margin of the abaxial surface. In other species of that section, the sepals are densely or sparsely puberulous or glabrous on the margin of abaxial surface, lacking a narrow strip of velutinous indumentum.

Subsect. 5. **Hastatae** (W. T. Wang) W. T. Wang in Acta Phytotax. Sin. 38(6): 503. 2000. —Sect. *Clematis* subsect. *Rectae* Prantl ser. *Hastatae* W. T. Wang in Acta Phytotax. Sin. 36(2): 159. 1998. TYPE: *C. hastata* Finet & Gagnep.

Woody vines. Branches glabrous. Leaves pinnate, rarely ternate, glabrous. Flowers 2~7 alone or together with several leaves arising from an axillary bud of old branch, pedicellate only. Sepals 4 or 6, valvate, spreading, white, oblanceolate or obovate-oblong, outside puberulous, on the very margin glabrous. Anthers narrow-oblong or linear, at apex obtuse or minutely apiculate.

2 species, endemic in Central China.

Johnson, Clematis 637. 1997; Grey-Wils. Clematis 106. 2000. TYPE: China. Sichuan (四川), Chengkou (城口), 1400 m, 1892-04-02, Farges 1155 (holotype, P!).

Woody vine. Branches shallowly 8-sulcate, glabrous; bud scales narrow-triangular or long ovate, 6~8 mm long, above sparsely puberulous. Leaves pinnate, 5~7-foliolate, seldom ternate, glabrous; leaflets subcoriaceous, those of lower pair of leaves narrow-ovate, 4.5~5.5 cm × 3.8~4.5 cm, at apex acute or slightly obtuse, at base subcordate, at margin entire, 3-parted or unequally 2-parted, those of upper pair triangular-linear or narrow-triangular, 2.5~5 cm × 0.9~1.4 cm, undivided, midrib abaxially slightly prominent; petioles 2~3.5 cm long. Flowers 2~7 arising from an axillary bud of old branch, 2.5~4 cm in diam.; pedicels 4~11.5 cm long, pubescent. Sepals 4, white, oblanceolate or narrow-oblanceolate, 1~2.2 cm × 0.4~1 cm, at apex obtuse or rounded, inside glabrous, outside densely appressed-puberulous, on margin glabrous. Stamens ca. 8 mm long, glabrous; anthers narrow-oblong, ca. 2 mm long, at apex obtuse or obscurely minutely apiculate. Ovaries pubescent; styles ca. 7 mm long, densely villous. Fl. Apr.

China (N Sichuan). On slopes in Valley.

Additional specimens examined. **China. Sichuan** (四川): Qingchuan (青川), along Fujiang River (涪江), 1925-04, Rock 12037 (GH, P).

18 光叶铁线莲 Fig. 10: 4~5

Clematis glabrifolia K. Sun & M. S. Yan in Bull. Bot. Res. Harbin 12(4): 327, pl. 3, fig. 1~6. 1992; W. T. Wang in Acta Phytotax. Sin. 26(2): 162. 1998; Grey-Wils. Clematis 79. 2000. TYPE: China. Just as *Clematis flammula* L. of the sect. *Clematis* subsect. *Rectae* Prantl, *C. cirrhosa* is a typical Mediterranean species and greatly variable in leaf and inflorescence morphology. In this revision, 5 varieties of this polytypic species are recognized. For understanding of the relationships among them further study is needed.

21a Var. *cirrhosa* Fig. 12: 1 ~ 2

Woody vine. Branches subterete or indistinctly tetragonous, very shallowly 4 ~ 10-sulcate, only on nodes sparsely puberulous, elsewhere glabrous. Leaves simple; leaf blades subcoriaceous, coriaceous, or thickly papery, narrow-ovate or ovate, seldom lanceolate, 1.5 ~ 5.5 (~ 8) cm × 0.9 ~ 3.4 (~ 5.5) cm, at apex acute, acuminate, or obtuse, at base truncate, rounded or subcordate, at margin crenate or denticulate, sometimes dentate or entire, undivided, rarely 3-lobed, on both surfaces glabrous or abaxially near base pilose, basal veins slightly prominent or nearly flat; petioles 0.5 ~ 2.4 cm long. Cymes 1 ~ 2 with 4 ~ 8 leaves arising from an axillary bud of old branch, 1-flowered; peduncles 0.8 ~ 3 cm long, sparsely puberulous or subglabrous; involucre broadly campanulate, 0.5 ~ 1.5 (~ 2) cm long, outside appressed-puberulous, indistinctly 2-lobed. Flower 2 ~ 4 (~ 7) cm in diam.; pedicel 3 ~ 5 mm long, velutinous. Sepals 4, suberect, oblong-obovate or oblong-elliptic, 2 ~ 3 (~ 5) cm × 1 ~ 1.4 (~ 3) cm, at apex rounded, often mucronate, inside glabrous, outside densely appressed-puberulous, on margin glabrous. Stamens 1.5 ~ 1.7 cm long; filaments lanceolate-linear; anthers narrow-oblong, 0.8 ~ 3.2 mm long, at apex obtuse. Ovaries densely puberulous; styles 1 ~ 1.5 cm long, densely villous. Achenes compressed, broadly ovate, broadly elliptic, or subrhombic, 3.5 ~ 4.6 cm × 2.5 ~ 3.2 mm, pubescent, at margin narrowly rimmed; persistent styles 3 ~ 5 cm long, plumose. Fl. Oct. ~ Apr. of the next year.

SW Asia (Cyprus, Isreal, Jordan, Libanon, Palestine, Syria, Turkey), S Europe (France, Greece, Italy, Malta, Portugal, Spain), N Africa (Algeria, Libya, Morocco, Tunisia). On coastal hills; 50 ~ 600 m.

C. calycina Ait. Hort. Kew. 2: 259. 1789; Sims in Curtis, Bot. Mag. 24: t. 959. 1806. TYPE: Spain. Minorca Island, no type specimen designated.

C. cirrhosa r *multifida* Moris, Fl. Sardoa 1: 14. 1837; Mora, Fl. Fun. Penin. Iber. 6: 679. 1878. TYPE: no type specimen designated.

C. cirrhosa var. *angustifolia* Loudon, Encycl. Trees & Shrubs 14. 1842. TYPE: no type specimen designated.

Leaves simple, usually 3-sect, or ternate, central segment or leaflet narrow-ovate in outline, 3-fid, central lobe lanceolate, at margin incised-dentate, lateral lobes small. Cymes 1~2 with leaves arising from an axillary bud of old branch; involucre usually covering the pedicel and calyx base, occasionally remote from them, broadly campanulate, 4~8 mm long, on top usually distinctly 2-lobed. Pedicel ca. 3 mm long. Anthers narrow-oblong. Fl. Oct.~Apr. of the next year.

S Europe (France, Portugal, Spain). On coastal hills; 100~500 m.

Specimens examined. France. Corse, Stephani 1937 (G).

Spain. Mallorca Island, Barcelo s. n., Belanger s. n., Bianor 1251, Boissier s. n., Gros 7390 (G), Lenander s. n., Schultze 19 (S), Vautier s. n. (G); Marratxi, Bianor 3616 (K).

21d Var. *pedicellata* DC. Syst. 1: 162. 1818; et Prodr. 1: 9. 1824; Loudon, Encycl. Trees

& Shrubs 14. 1842. —— *C. pedicellata* (DC.) Sweet, Hort. Brit. 2. 1827; Lindl. in Edwards, Bot. Reg., n. ser., 10: t. 21. 1847. TYPE: Spain. ‘Isl. Majorca’, A. Richard s. n. (holotype, not seen). Fig. 12: 9 ~ 10

C. cirrhosa auct. non L.: Sims in Curtis, Bot. Mag. 27: t. 1070. 1807.

Leaves simple, undivided or 3-parted to 3-sect, or nearly ternate, at margin 1 ~ 2-denticulate or entire. Cymes singularly arising from leaf axils of hornotinous branch; involucre ca. 6 mm long, distinctly 2-lobed, its tube ca. 2.5 mm long and its lobes deltoid or ovate, 2.5 ~ 4 mm long. Pedicel 4 ~ 20 mm long. Anthers oblong, ca. 1.2 mm long.

Spain (Majorca Island).

I have seen only one specimen of this variety, deposited in S and lacking field notes. Upon this specimen the two figures (Fig. 12: 9 ~ 10) of this variety are based.

21e var. **barnadesii** Pau in Bol. Soc. Arag. Cien. Nat. 3: 10. 1904; Rignal in Anal. Inst. Bot. Cavan. 32(2): 465, fig. 1 ~ 8. 1975; M. Johnson, Clematis 375. 1997; Grey-Wils. Clematis 92. 2000. TYPE: Spain. Cartagena, 1901-10-25, Jimenez s. n. (holotype, not seen).

Fig. 12: 3 ~ 4

Leaves simple, undivided, at margin densely and coarsely serrate. Cymes ca. 2 with ca. 6 leaves arising from a terminal bud of annotinous branch; involucre ca 15 mm long, manifestly 2-lobed, its tube ca. 6 mm long, its lobes narrow-triangular or narrow-ovate, 7 ~ 10 mm long. Pedicel ca. 16 mm long. Anthers narrow-oblong, 3 ~ 3.4 mm long. Fl. Oct. – Nov.

SW Spain (Cartgena).

Specimens examined. **Spain**. Cartagena, 1902-11-06, ? Jimenez s. n. (S); same locality, 1905-11-06, Jimenez s. n. (G).

21f Var. **bibracteata** W. T. Wang, var. nov. Fig. 12: 7 ~ 8

A var. *cirrhosa* et varietatibus ceteris *C. cirrhosae* statim differt cymae bracteis duabus oppositis liberis.

Leaves simple, undivided, rarely above base 3-lobulate, at margin few-denticulate. Cyme 1 with 2 leaves together arising from an axillary bud of old branch; bracts 2, free, opposite, spreading, triangular, ca. 1.6 mm × 1 mm, abaxially appressed-puberulous. Pedicel ca. 2 mm long. Anthers narrow-oblong, 2.2 ~ 3 mm long. Fl. Mar.

Cyprus. Limassol, 1956-03-23, G. A. Mavromoustakis s. n. (holotype, US).

This new variety is distinguished from other varieties of *C. cirrhosa* by its free bracts. In other varieties, the two opposite bracts of the 1-flowered cyme are more or less connate into a tube-bearing involucre. With such a primitive character, var. *bibracteata* may be a relict primitive from of the subsect. *Cirrhosae*.
